

Jadhav Ashvini Manohar

1. wap ask the user take two number print subtraction multiplication and division

Example: replace a and b with random integers using random package

```
In [19]: import random

a=random.randint(1,100)
b=random.randint(1,100)
c=a+b

print("a=",a)
print("b=",b)

print("addition=",c)
print("Subtraction=",a-b)
print("Multiplication=",a*b)
print("Division =", round(a / b, 2))
```

```
a= 67
b= 56
addition= 123
Subtraction= 11
Multiplication= 3752
Division = 1.2
```

2.wap ask the user take the radius find the area of circle

Example: take pi value from math package

r value using random

```
In [21]: import math
import random

pi=math.pi
r=random.randint(1,100)

area_of_circle=pi*r*r

print('area_of_circle :',round(area_of_circle,2))
```

```
area_of_circle : 16741.55
```

3.wap ask the user take height and breadth find the area of traingle

area_of_traingle=0.5bh

```
In [22]: import math

b = float(input("Enter breadth: "))
h = float(input("Enter height: "))

area_of_triangle = 0.5 * b * h
```

```
print("Area of Triangle =", round(area_of_triangle, 2))
```

Area of Triangle = 40.0

4. wap ask the user take 3 numbers find the average

```
In [23]: import math

n1=float(input('enter the value for n1:'))
n2=float(input('enter the value for n2:'))
n3=float(input('enter the value for n3:'))

avg=(n1+n2+n3) / 3

print("Average =", round(avg, 2))
```

Average = 20.0

5. wap ask the user take the bill amount and tip amount calculate total bill

```
In [24]: import math

bill_amount = eval(input('Enter the bill amount :'))
tip_amount= eval(input('Enter the tip amount:'))

total_bill= bill_amount + tip_amount
print("the total amount=",round(total_bill,2))
```

the total amount= 12600.34

6.wap ask the user take the salary, percentage of tax calculate tax amount

```
In [25]: import math

salary = eval(input('enter your salary:'))
percentage_of_tax =eval(input('percentage of tax :'))

tax_amount = (salary * percentage_of_tax ) / 100

print('tax_amount=:',round(tax_amount,2))
```

tax_amount=: 60000.0

7.wap ask the user take the value in dollar convert into rupees 1\$=80rs

```
In [26]: import math

dollars = float(input("Enter dollars: "))
rupees = dollars * 80
print("Rupees =", round(rupees, 2))
```

Rupees = 2720.0

8.wap ask the user take weight in kgs convert into pounds 1kg=2.2pounds

```
In [27]: import math

weight_kg = float(input("Enter weight in kilograms: "))
```

```
pounds = weight_kg * 2.2  
print("Weight in pounds =", round(pounds, 2))
```

Weight in pounds = 55.0

In []:
